How to enable laser warmup in JobControl

First open the machine lid and manually locate the laser head in a central location (*X & Y*).

Next power on the laser and open the laser software JobControl
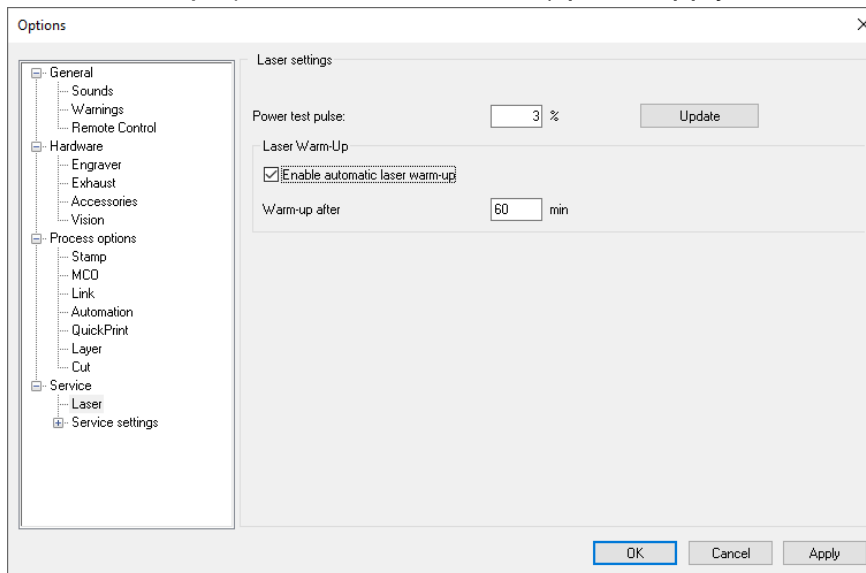

Then connect in JobControl

Once connected, navigate to Options within JobControl - This can be done in 2 ways as per below images.

Once in JobControl Settings navigate to Service/Laser & tick the box "Enable automatic laser warm up" (*default time is 60mins*) press apply and then OK

Once completed the machine lid can be closed and will reference as per normal start-up and operate as normal. The machine will give an audible beep to show it is warming up as required.
